

ChainMon

\ [fu 0g0,•J0y0<0 S o l a n a N 0n^@}q0LR;0~0Æ0<0â0ó0¹0¿0üSÎ–Æ R P G

The Problem & Our Solution

Kids love Pokemon-style games, but web3 games are too complex, text-heavy, and finance-focused for young players.

- Existing crypto games assume adult literacy in wallets, gas, and trading jargon
- Young players want fun, color, and simple taps, not spreadsheets and seed phrases
- ChainMon hides blockchain complexity behind a classic catch-battle-level RPG loop
- Ownership and trading are available but invisible until the child chooses to look
- Built on Solana so compressed NFTs make owning thousands of monsters affordable

How It Works

A simple game client talks to an Anchor program on Solana, where every monster is a compressed NFT with on-chain stats.

- Player walks through 2-3 zones, meets wild monsters, and plays a tap/swipe catch mini-game
- Caught monsters are minted as compressed NFTs via Metaplex Bubblegum on Solana
- Turn-based battles use 4 basic moves per monster, resolved in the game client
- After battles, level and stat updates are written to on-chain metadata via Anchor
- Phaser.js or Unity WebGL client reads on-chain state so progress is provably owned

Built with

Solana, Anchor, Rust, Metaplex
Bubblegum (cNFTs), Phaser.js or Unity
WebGL, Solana Web3.js, Devnet

Why Now & What's Next

Compressed NFTs finally make minting thousands of cheap monster assets on Solana affordable for a kid-friendly game economy.

- cNFTs cut minting costs enough to give every player many monsters without friction
- MVP proves the core loop: catch, battle, level, own, all on devnet
- Next: PvP battles between players' monster teams
- Next: breeding and evolution mechanics using on-chain randomness
- Next: mobile-friendly client with custodial wallet onboarding for kids
